

LP-2 (P-5 CHATBOT ADMISSION)

5. Develop an elementary chatbot for any suitable customer interaction application.

```
import re

print("---- Online Shopping Chatbot ----")

while True:

    msg = input("You: ").lower()

    if re.search(r"hello|hi", msg):
        print("Bot: Hello! Welcome to our shopping store.")

    elif re.search(r"products|items", msg):
        print("Bot: We sell mobiles, laptops and headphones.")
    elif re.search(r"mobile", msg):
        print("Bot: Mobiles start from ₹10,000.")
    elif re.search(r"laptop", msg):
        print("Bot: Laptops start from ₹40,000.")
    elif re.search(r"headphone", msg):
        print("Bot: Headphones start from ₹1,500.")
    elif re.search(r"order|buy", msg):
        print("Bot: Your order can be placed online.")
    elif re.search(r"delivery", msg):
        print("Bot: Delivery takes 3 to 5 days.")
    elif re.search(r"payment", msg):
        print("Bot: We accept UPI, Cards and Cash on Delivery.")
```

```
elif re.search(r"contact", msg):  
    print("Bot: Call us at 9876543210.")  
elif re.search(r"bye|exit", msg):  
    print("Bot: Thank you for visiting our store.")  
    break  
  
else:  
    print("Bot: Sorry, I don't understand.")
```

Viva Questions & Answers — Chatbot Practical

1. What is a chatbot?

A chatbot is a software program that interacts with users using text or voice and provides automatic responses.

2. What is an elementary chatbot?

An elementary chatbot is a simple chatbot that gives predefined responses using conditions or pattern matching.

3. Which language is used in your chatbot?

Python.

4. Which module is used in your program?

re module for regular expression matching.

5. Why did you use the re module?

To match user keywords and patterns easily.

6. What is regular expression?

Regular expression is a sequence of characters used for pattern matching in strings.

7. What does re.search() do?

It searches a pattern inside a string and returns a match if found.

Example:

```
re.search("hello", msg)
```

8. Why is lower() used?

To convert input into lowercase for case-insensitive comparison.

9. What is the use of while True?

It creates an infinite loop so the chatbot continues conversation until exit.

10. How does the chatbot stop?

Using break statement when user enters bye or exit.

11. What type of chatbot is this?

Rule-based chatbot.

12. Why is it called rule-based chatbot?

Because responses are based on predefined rules and conditions.

13. Does this chatbot use Artificial Intelligence?

No, it uses simple rules and pattern matching.

14. Difference between AI chatbot and rule-based chatbot?**Rule-Based Chatbot AI Chatbot**

Fixed responses	Learns dynamically
Uses conditions	Uses Machine Learning
Simple	Intelligent

15. What are the applications of chatbot?

- Customer support
 - Admission inquiry
 - Banking
 - Healthcare
 - E-commerce
-

16. What is customer interaction application?

An application used to communicate with customers and solve their queries.

17. Why did you use elif statements?

To check multiple conditions efficiently.

18. What is the advantage of chatbot?

- Fast response
 - 24×7 support
 - Reduces human effort
-

19. What are limitations of your chatbot?

- Cannot learn automatically
 - Only predefined answers
 - Cannot understand complex queries
-

20. How can you improve this chatbot?

- Add database connectivity
 - Add voice support
 - Use AI/ML
 - Use NLP
-

21. What is NLP?

Natural Language Processing helps computers understand human language.

22. What is pattern matching?

Finding specific words or patterns in user input.

23. Can chatbot work without internet?

Yes, simple Python chatbot can run offline.

24. Why is chatbot important?

It improves customer service and saves time.

25. Can chatbot replace humans completely?

No, complex situations still require human support.
